Functions and Signals (according to VITA 62.0)

Signal Name	Type	Description
FAIL*	Output	Indicates to other modules in the system that a failure has occurred in one of the outputs. Please refer to Figure 2
SYSRESET*	Output	Indicates to other modules in the system that all outputs are within ¹ their working level. Please refer to Figure 2
INHIBIT*	Input	Controls power supply outputs. This signal in conjunction with Enable controls the outputs. Please refer to Table 1 and Figure
ENABLE*	Input	Controls power supply outputs. This signal in conjunction with INHIBIT controls the outputs. Please refer to Table 1 and Figure 1
GA0-4*, GAP*	Input	Used for geographical addressing. GA4 is the most significant bit and GA0 is the least significant bit.
SCL, SDA	Bidirectional	I2C bus Clock and Data respectively. Through this bus the voltage and temperature readouts can be shared.
Sync In	Input	The Sync signal is used to allow the power supply frequency to sync with the system frequency. (Optional)
Sync Out	Output	Send Internal switching frequency. (Optional)
VOUT SENSE	Input	The SENSE is used to achieve accurate load regulations at load terminals (this is done by connecting the pins directly to the load's terminals).
12VCS	Bidirectional	Support current share between Outputs. Two pins required. ^{1 2}
12V ACS	Bidirectional	Support Active current share between Outputs. See Current Share para. ^{1 2}

Detailed Information

1. Input Voltage Operation.

The M4703 steady state operation is per Mil-STD-704. Unit will work through all Normal Transients per Mil- STD-704 B to F, protected to all other transients and interrupts.

2. Outputs Voltage Regulation

The M4703 contains accurate internal sense lines to keep output voltage at less than 3% regulation for all Line / Load and temperature range (see Table 2).

The M4703 contains three 12V sense line pairs. These sense lines are all shorted together internally. For proper operation, connect only a single sense line to the point of load regulation. The same recommendation applies to the sense return line.

For proper current shared operation, connect a single sense line from each M4703 to the same point of load regulation.

Output	12V Output	3.3Vaux Output
Voltage Range	11.85 – 12.15	3.25 – 3.4

Figure 3 – Sense Lines connection

3. Current Share (C.S)

Current Share of two or more units is optional (Contact Factory)
12V output and 3.3VAux will current share with about 2-4A load balance.

3.1 Active Current Sharing (A.C.S)

Current share done in a closed-loop. All paralleled outputs are compared and feedback is used to balance their load current. The result is a more stable, less sensitive output voltage without voltage drop. Typical Load Balance of about 1 to 4A for all Load range is expected.

ACS is supported by the 12V output. Optional for 3.3Vaux^{1 2}.

3.2 3.3Vaux Passive current sharing (P.C.S)

Current sharing is done in open loop, output voltage drops as a function of output load. Load Balance of about 5-10% is expected. 3.3Vaux ACS is optional^{1 2}

3.3 Current share connection between two Units.

For a required output to current share please connect the following Pins between the two units

- PO#_Sense & PO#_Sense_RTN (for best performance, Pins from paralleled units should be connected to a single point and as close as possible to the load point)
- Connect A7, B7 AND C7 to corresponding pin between units (A7 to A7, etc.)
- Connect B1 for 3.3Vaux ACS (Optional, not per SOSA pinout. This pin is internally N.C if not ordered)

When not used, all share pins can be left open.

Figure 4 -Typical ACS Dynamic Load of Two 12V Paralleled Outputs

Notes:

¹ When not used, share pins can be left open.

² When ordering 3.3Vaux P.C.S or Non-Current Share unit, those pins are Internally disconnected
