Functions and Signals

INHIBIT signal

The ***INHIBIT*** signal is used to turn the power supply ON and OFF.
TTL "1" or OPEN will turn on the power supply (For normal operation leave the signal not connected). TTL "0" or SHORT will turn off the power supply.
This signal is referenced to ***INHIBIT RTN*** pin and is isolated from all other pins.

SYNC signal

The ***SYNC*** signal is used to allow the power supply frequency to sync with the system frequency. The system frequency should be 250 kHz ± 10 kHz.
When not connected the power supply will work at 250 kHz ± 10 kHz.
This signal is referenced to ***SYNC RTN*** pin and is isolated from all other pins.

SENSE

The ***SENSE*** is used to achieve accurate load regulation at load terminals of **output #4**. This is done by connecting the pins directly to the load terminals. The remote sense correction function is limited to voltage drop between converter's output and load terminals of 2% to 5%, or up to 0.5V, the least of the two.
When not used, connect ***SENSE*** to ***OUT #4*** and ***SENSE RTN*** to ***OUT #4 RTN.***
Do not leave ***SENSE*** and ***SENSE RTN*** pins unconnected. These pins can be tied internally to avoid external connection, if function is not required – *consult factory.*
